ing chief, noting particularly his enviable military record and personal qualities of diligence and adaptability. Now making his home in Castella, California, he enlisted in the Navy at Grand Rapids, Michigan, nearly standing performance as the Group's lead 25 years ago. Photo by W. E. Petree, AN

EDITORIAL

Here's Where NOTS Figures In Big Picture

Our location in the world and its geography have dictated that sea power is the sine qua non of our economic and political survival. But a Navy is not an end in itself, nor is sea power. Our real objective is the advancement of the national interest, which, like geography, is unchanging. We must, therefore, bend the complexities of scientific advancement to the service of sea power, and sea power to the service of the nation.

Let me cite a striking example. Technological advances in propellants and weapons permitted the design and construction of the POLARIS missile. Nearly simultaneously, advances in nuclear propulsion, communications, navigation, and hull construction permitted the concept of the POLARIS weapons system. Technology has been bent to the service of sea power and sea power to the service of the nation. We have used the oceans to our national advantage, and let me assure you that we intend to continue to do so!

We have made similar advances with SIDEWINDER, SPARROW, BULLPUP, ASROC, SUBROC. Much still remains to be done. We urgently need improvements in the detection and classification of submarines. We need to make best use of the communication and navigation advantages of satellites, and of space vehicles. There is, in fact, no area of technology which may be left unexplored in our advancement of sea power. Our accomplishments of the past merely point the way to our goals of the future - a future in which the value of the sea may be multiplied many fold. We must continue to bend technology to the service of sea power and sea power to the service of the nation.

The Navy has aimed high and accomplished much in the past few years. In ships, missiles, and planes we have made advances which by their very regularity seem now to be routine. But that is the trick of the thing - making difficult achievements look routine is a tremendous compliment to the men of government and industry whose cooperation and ingenuity have added so much to the structure of sea power. The future is no less demanding than the recent past, and I look forward to the same degree of teamwork and ability in the future.—(From a recent speech by the CNO).

WHAT'S MY LINE?

How good are you at guessing a person's occupation? As a continuing feature with a two-fold purpose, the Rocketeer will publish pictures of personnel employed here. It'll be your job to guess their occupations. Once you do, of course, you'll also have had the chance to meet some of the people who make ours the world's finest command. See page four for their identities.
